

Michigan Philosophy News

Fall 2008

*for friends, alumni, alumnae of the Department of Philosophy,
The University of Michigan, Ann Arbor*

INSIDE THIS ISSUE

- Letter from the Chair
- Eric Lormand: “Function: Under Construction”
- Spotlight on Recent Graduates
- Members of the Faculty
- Contributions to the Department

Dear Friends of Michigan Philosophy,

Greetings from Ann Arbor! I am pleased, once again, to be able to bring you up to date on the Philosophy Department’s recent accomplishments and activities. While there have been changes in personnel, and while the Department faces major challenges, our basic mission remains the same — providing our students with the best possible overall education in philosophy — and we are carrying out this charge with great effectiveness and enthusiasm. Generations of faculty, students, and staff have laid a strong foundation upon which we continue to build. Michigan remains one of the premier centers of philosophical thought in the world, with at most four or five peers, and our students continue to excel in a wide variety of intellectual and non-academic pursuits. We are also fortunate to have large base of alumni and alumnae who support the Department in many ways. This fall, for example, a generous donation from Marshall M. Weinberg funded a major conference “The Future of Cognitive Science” that brought six major figures in philosophy, psychology, biology, cognitive science and physics to campus for two days of talks. The conference was terrifically informative, and I am sure it will provide a fertile ground for interdisciplinary discussions for a long time to come. (Beginning in January, you will be able to view filmed versions of the conference presentations on the Departmental website: [http://www.lsa.umich.edu/philosophy/.](http://www.lsa.umich.edu/philosophy/))

Faculty News. Michigan’s philosophy faculty engaged in a wide variety of scholarly activities this year. As always, our members received many awards and honors. **Elizabeth Anderson** has been elected Fellow of the *American Academy of Arts and Sciences*. Election to the Academy, one of the Nation’s oldest and most prestigious honorary societies, is an extraordinarily high honor. Liz joins Allan Gibbard, Larry Sklar, Ed Curley, Ken Walton and Peter Railton as Academy Fellows. **Ed Curley** received a major fellowship from the *Institute for Advanced Study at Princeton* for a project on religious toleration. Ed was also honored as LSA’s *Distinguished Senior Faculty Lecturer* for 2008. **Boris Kment** was awarded a fellowship from the *National Endowment for the Humanities* (2008-09), and received the *Emerging Scholars Prize* from the Institute for the Humanities, University of Michigan. **Larry Sklar** completed his term as President of the Philosophy of Science Association, and delivered the Presidential Address, “I’d Love to Be a Naturalist - If Only I Knew What Naturalism Was” this November. **Thony Gillies** received a prestigious NSF grant “Context and Accommodation in the Semantics of Modal Constructions.” Thony used some of

the money to run a highly successful interdisciplinary speaker series last winter.

The Department welcomes three new faculty members this year, all with interests in the philosophy of science. Professor **Gordon Belot**, who has held positions at NYU, Princeton, and Pittsburgh, works on a wide variety of topics in philosophy, with special focus on the metaphysical issues that arise in space-time theory. Professor **Laura Ruetsche**, who has held positions at Middlebury and Pittsburgh, focuses on issues having to do with the interpretation of quantum mechanics. Laura is also a leading figure in the study of gender and science. Assistant Professor **David Baker**, a Michigan B.A. who received his Ph.D. from Princeton this year, works on metaphysical and epistemological issues that arise in quantum theory. David also has substantial research interests in the philosophy of religion and moral philosophy. When added our substantial existing strength in the area, these three make Michigan perhaps the best place in the world to study the philosophy of science.

Though these additions soften the blow, we must bid bittersweet farewells to three valued member of the faculty. After more than twenty years of service, **Steve Darwall** has retired from the University, and has accepted a position at Yale. Steve was one of our most dedicated undergraduate teachers and most active graduate advisors. He also served with uncommon distinction in a variety of important administrative roles, including Department Chair, Director of the LSA Honors Program, and Chair of the LSA Library Committee. We wish Steve all the best in his new position. **Ian Proops**, an Associate Professor who specializes in the history of analytic philosophy, will be taking up a position at the University of Texas (Austin) beginning in January. I am certain our students will miss Ian's well-received introductions to philosophy, and his popular courses on Kant and on Frege, Russell and Wittgenstein. Finally, Assistant Professor **Andy Egan** will be leaving to take up a tenured position at Rutgers beginning in September. Andy, who works in many central areas of philosophy, was an especially active graduate advisor. We are unfortunate to lose him.

Finally, on a sad note, I must announce that **Arthur Burks**, one of the giants of Michigan philosophy (and computer science) passed away on May 14, 2008 in Ann

Arbor. For a tribute to Art and an account of his many contributions to the University, the Department and the discipline of philosophy see p. 16.

Undergraduate News. Our reputation for outstanding teaching attracts students to our major, and so our undergraduate program continues to grow. The 2007-08 academic year showed an increased enrollment of one hundred forty-one concentrators and eighty-three minors. We awarded sixty-six B.A. degrees in April 2008 and expect to award about the same number in April 2009.

This year's William K. Frankena Prize for excellence in the undergraduate concentration (funded by a generous contribution from Marshall M. Weinberg) was awarded to **Amanda J. Hicks**. Amanda will be attending law school in the fall of 2009. The Haller prize, which is awarded for exceptional papers written in an upper-level philosophy course, was given to **Chris Detjen** for his essay "Rawls in the Age of Floods: Ensuring Climate Justice Through Time and Space."

Last year saw the highest number of senior honor theses ever completed: nine! Liz Anderson supervised three: **Kayla Nile Arslanian's**, "A Wolf in Sheep's Clothing: Invoking a Principle of Sincerity to Protect the Public Political Domain from Disguised Private Reasons;" **Matt Owens'** "The Problem of Testimony in Asylum Hearings;" and **Eric Li's** "Self and the Social Terrain: Racial Identity via an Asian American Perspective." **Thomas M. Hartsig** wrote, "Unique Factorization and Dedekind's Theory of Ideals: A Mathematical Perspective... With a Slight Philosophical Bent," under the guidance of Jamie Tappenden. **Adam Siroky** wrote "Piecing Together the Fictionality Puzzle" under Allan Gibbard. Chandra Sri-pada and I advised **Jonah Zaretsky** in his writing of "A Cognitive Theory of Schizophrenic Delusions." **Todd Hollon's** "One Understands [a Proposition] if one Understands its Constituents Parts," was supervised by Boris Kment. **Christina Spallina**, advised by Ed Curley, wrote "Examination of Church and State Relations." Ed also advised **Joshua Blanchard's** "Soft Rationalism in the Epistemology of Religion."

The Department now sponsors three undergraduate philosophy discussion clubs: the Philosophy Club; the Socratic Club, and the Student Secular Alliance. It is great to

see so much philosophical discussion taking place outside classroom settings. The undergraduate student journal, the *Meteorite*, continues to thrive and is being published both in print and online. Check the department's web site for more information on the clubs and *Meteorite*:

<http://www.lsa.umich.edu/philosophy>.

Graduate News. Our graduate students continue to win prestigious awards and develop their professional reputations. **Vanessa Carbonell, Dustin Locke, Howard Nye** and **Tim Sundell** all won *Rackham Predoctoral Fellowships* for 2008-09. This is a highly competitive prize and the Department has never had so many recipients in one year! Vanessa also received a Rackham Graduate School *Outstanding GSI Award*, a great and rare honor that goes only to the most effective graduate student instructors. Dustin also won a *Rackham Research Grant* to fund time at the Australian National University and the University of Sydney. **David Dick** was awarded the coveted *Charlotte W. Newcombe Doctoral Dissertation Fellowship* for the academic year 2008-09. David also received the *Hough Fellowship in Ethics* for Winter 2008. **Steve Campbell, Jonathan Shaheen, and Dave Wiens** all received *Weinberg Summer Fellowships*. Jonathan also won a coveted *Fulbright Fellowship* to study logic in Amsterdam for the next two years. First year student, Nat Coleman won a *Rackham Graduate Student Research Grant*. **Alexa Forrester** was awarded the *Patricia Susan Feldman Award for Excellence in Philosophy*. **Eduardo Garcia-Ramirez** was awarded a prestigious fellowship by the Mexican Government. The first *Marshall M. Weinberg Summer Dissertation Fellowship* went to **Erica Lucast Stonestreet**. Erica also won the University's *Susan Lipschutz Award*.

Our students gave many professional presentations this year. **David Wiens** presented "Taking the Higher-Order Road: An Institutional Critique of Statism" to the Association for Legal and Social Philosophy and the Princeton Graduate Conference in Political Theory. **Ian Flora** read "Aristotle on the Real Difference between Belief and Imagination" at the Marquette Summer Seminar in Ancient and Medieval Philosophy. **Dustin Locke** presented "Ramsification and Knowledge-which" to the University of Texas Graduate Student Conference and the Society for Exact Philosophy. **Amanda Roth** gave, "But You Don't Respect Me: Second Personal Respect and Gendered Perception" to the Society for Analytical Feminism.

Our students have also been making their marks in the arena of scholarly publication. **Dustin Locke's** "A Partial Defense of Ramseyan Humility" will appear in D. Bradon-Mitchell and R. Nola (eds.) *Conceptual Analysis and Philosophical Naturalism*. **Josh Brown** and **Tim Sundell**, with Peter Ludlow, wrote "Philosophy of Linguistics" for S. Sarkar and M. Fagan (eds.) *Routledge Encyclopedia of the Philosophy of Science*. **Alexandra Plakias**, with John M. Doris (Ph.D '96) wrote two papers — "How to Argue about Disagreement: Evaluative Diversity and Moral Realism" and "How to Find Disagreement: Philosophical Diversity and Moral Realism"— that have appeared in W. Sinnott-Armstrong (ed.) *Moral Psychology*. **Steve Campbell's** "Hare on Possible People" appeared in in the *Journal of Applied Philosophy*, Vol. 24, 2007.

This year's *Charles Stevenson Prize for Outstanding Candidacy Dossier* went to **Amanda Roth** for her excellent papers titled "But You Don't Respect Me..." and "Dewey, Feminist Epistemology, and Objectivity: An Internal Realist Interpretation." The *John Dewey Prize for outstanding performance as a Graduate Student Instructor* went to **Tim Sundell**. Both prizes are funded by a generous gift from Marshall M. Weinberg (B.A. '50). The *Cornwell Fellowship for Outstanding Intellectual Curiosity and Scholarly Promise* was awarded to **Ian Flora**.

The Department saw four of its students complete dissertations during 2007-08: **Josh Brown, Jim Staihar, Erica Lucast Stonestreet** and **Gabriel Zamosc-Regueros**. For further information on these students see "Spotlight on Recent Graduates" (p. 17).

Events. As usual, we had a busy schedule of events this past year. **Peter Railton** delivered his inaugural lecture as the John Stephenson Perrin Professor of Philosophy. His "As the Eye to a Star...: toward a Theory of Desire and of all-things-considered-rationality in Desire" was received by a large and appreciative audience. **Carl Hofer**, from Universitat Autònoma de Barcelona was the Department's *Weinberg Distinguished Visiting Professor* for 2007-08. Carl taught a seminar on the philosophy of probability and philosophy of science. He also delivered the Marshall M. Weinberg Lecture. His provocative talk, "Chance, Time and Newcomb Problems" generated a great deal of productive philosophical discussion.

Professor **Stephen Yablo** of MIT was our Nelson Philosopher-in-Residence for the fall of 2007. He delivered three fascinating lectures on aspects of metaphysics,

philosophy of mind, and language entitled: “Truth and Aboutness,” “A Problem about Permission and Possibility,” and “Extrapolation.” In October, the Department sponsored a two-day conference that focused on metaphysics and philosophy of mind in early modern philosophy. **Tad Schmaltz** of Duke, **Alison Simmons** of Harvard, and **Dan Kaufman** of Colorado presented papers to large, receptive audience. The twenty-ninth Spring Colloquium, which is run by our graduate students, was entitled “Philosophical Methods.” **Alexandra Plakias** organized the event, which featured the speakers **Frank Jackson** (Princeton and La Trobe), **Jesse Prinz** (North Carolina), and **John Doris** (Washington University). Graduate students commentators were **Tim Sundell**, **Alex Plakias**, **David Plunkett** and **Neil Mehta**.

This year’s *Tanner Lecture on Human Values* was delivered by **Brian Skyrms**, Distinguished Professor of Logic and Philosophy of Science and Economics, at University of California Irvine. His lecture “Evolution and the Human Contract” sought to explain how moral norms of behavior might have arisen in an evolutionary environment in which all individuals are seeking to maximize their own well-being. The ensuing Tanner Symposium featured comments from the philosopher **Michael Smith** (Princeton), the political scientist **Elinor Ostrom** (Indiana) and economist **Peyton Young** (Oxford and The Brookings Institution).

The Department also hosted talks by **Pierre Destrée** (Louvain), **David Estlund** (Brown), **Richard Kraut** (Northwestern), **Marc Lange** (North Carolina), **Margaret Little**, (Georgetown), **Genoveva Martí** (ICREA & Universitat de Barcelona), **Trenton Merricks** (Virginia) and **Katja Vogt** (Columbia).

I hope you have a chance to read **Eric Lormand**’s lucid and captivating article “Function: Under Construction” which follows this letter. The essay investigates some of the more difficult and perplexing issues in the philosophy of mind. It previews work that will appear in a new book Eric is completing, entitled *Staring Down the Mind’s Eye*.

I wish you the best for the coming year!

Sincerely,

James M. Joyce,
Chair

COMMENCEMENT ON THE DIAG
SPRING 2008

BURTON TOWER

ANGELL HALL IN WINTER

FUNCTION UNDER CONSTRUCTION

Eric Lormand

Consciousness seems to depend on mental representation or meaning, on what it is for a mental state to be “about” some topic. What something is “about” seems to depend on its teleological “functions”—what it is “supposed to” do or what it is somehow “defective” if it does not do. Understanding such teleological functions is Job One of this essay. My goal is to describe a general “constructive” theory of functions which I think improves and unifies the dominant heretofore competing theories. Before getting to Job One, however, I will first raise the stakes by discussing consciousness and its connections to morals and meaning.

JOB TWO

How it is that anything so remarkable as a state of consciousness comes about as a result of irritating nervous tissue, is just as unaccountable as the appearance of Djin when Aladdin rubbed his lamp.

That was the pessimistic assessment at the dawn of scientific psychology, from the otherwise famously optimistic biologist Thomas Huxley, known as “Darwin’s Bulldog”. Despite the many subsequent scientific advances in understanding the mechanisms of perception, thought, and communication, and despite the many subsequent philosophical advances in understanding the nature of mental representation and meaning, conscious experience is still The Rub.

Contemporary Doubting Thomases converge on a general characterization of the mystery. Thomas Nagel writes that “consciousness is what makes the mind/body problem really intractable”, identifying its most troublesome feature thus:

An organism has conscious mental states if and only if there is something it is like to *be* that organism—something it is like *for* the organism. We may call this the subjective character of experience

Joe Levine similarly insists that “what is at issue is the ability to explain qualitative character itself; why it is like what it is like to see red or feel pain”. It would be good to give clear examples of conscious states beyond *seeing red* and *feeling pain*, to contrast these with clear cases of nonconscious states. Unfortunately, there are precisely zero noncontroversial candidates for nonconscious states, and a surprisingly long list of controversial candidates for conscious states.

Here is the quickest and most sweeping way to see that there are no untendentious examples of nonconscious states. Since it is so difficult to explain experience as a combination of nonexperiential things, some influential philosophers have been driven, by respectable argument, to the view that experience is a *fundamental* feature of the world, like gravitation or

electromagnetism or whatever underlies them. But just as virtually everything exerts fundamental forces like gravitation and electromagnetism, so if experience is fundamental we might expect virtually everything to have experiences—even cells and rocks and raindrops and atoms. This is called “panpsychism” or, more precisely, “panexperientialism”. To be fair we cannot conveniently dismiss panpsychism using bedrock assumptions about which entities lack experiences.

To zoom in on states that are uncontroversially conscious experiences, we have to zoom in on creatures that are uncontroversially conscious *experiencers*. This calls for postponing discussion of the following cases:

- 1a:** Nonbiological beings such as laptops, robots, deities, and ghosts—(potential) robots *seem* nonconscious because they aren’t alive, but (potential) spirits *seem* conscious despite not being alive.
- 1b:** Nonhuman biological beings such as plants, animals, and extraterrestrial life—some animals *seem* to have experiences (bugs? shrimp? lizards? pigeons? bats?), but perhaps a degree of self-consciousness is required for full-fledged experience, and perhaps only language users qualify. At the other extreme, vegetarians tend to fall silent when roast-beast eaters ask how they know plants do not feel pain.
- 1c:** Humans far from adulthood, such as fetuses, infants, and small children—some of the dispute about abortion turns on whether fetuses suffer, an intuitively open question. It would be a symptom of pathology intuitively to deny experience in the face of a normal newborn or a toddler, but to deny this based on the theoretical need to explain self-consciousness or “childhood amnesia” is merely a symptom of philosophy.
- 1d:** Adult human beings under extreme medical duress, such as comas, brain trauma, or anesthetic drugs—we entertain tales of near-death *experiences* from the nearly brain-dead, and we worry (with indirect evidence that this has often happened) that anesthetics merely paralyze us and make us forget the excruciating experiences.
- 1e:** Medically healthy human beings whose minds have undergone extremely limited developmental paths, such as people extremely mentally impaired or people raised by wolves—there are live theories according to which consciousness is a sophisticated cultural achievement rather than a primitive biological achievement.
- 1f:** Apparently nonactual beings culled from philosophical thought experiments, such as alleged zombies, group minds, and homunculi or sentient subsystems within minds. As usual, theorists disagree squarely about the proper assessment of such thought experiments, about what it is intuitive to say about imagined cases, and about whether the cases play tricks on intuitions.

That leaves, as noncontroversial experiencers, only Human, Old-enough, Minimally-healthy, Incarnate Experiencers, or “Homies”, for short. I am a Homie and I write as if you are too. If you doubt there are Homies besides yourself, treat the plural forms of “Homie” and “experiencer” as typos, and read “we” and “us” as applying specifically to Your Highness.

What sorts of Homie states are uncontroversial examples of experiences? Here I count six categories of nonstarters. These states too theoretically charged for us to begin with.

- 2a:** Intuitively nonmental states, including both “outer” states such as one’s location and hair color, and “internal” states that contribute to behavior, such as the conditions of one’s digestive system, one’s atomic particles, and one’s brain chemicals.
- 2b:** Aspects of our minds that are merely dispositional, such as forgetfulness, cleverness, and skills—since dispositions need not even be exercised to be real, it is odd to imagine them constantly participating in our swarms of conscious experiences, but perhaps they participate in a way that is hard to separate out (forming part of a constant background of experience, say), or perhaps the subsystems underlying these dispositions within our minds have these states as their own experiences, separate from “ours” (see category 1f above).
- 2c:** Sensory-deprivation states such as those during sleep (including dreams, sleepwalking and sleeptalking), hypnosis, or deep meditation—perhaps dreams do not happen consciously during sleep, but instead dream scripts are nonexperientially smuggled into memory, so that upon waking we misremember ourselves as having had conscious dream experiences during sleep.
- 2d:** Individual states that persist through sleep, even if they also manifest themselves during wakefulness, such as beliefs, desires, and other “propositional attitudes.” If an attitude is nonexperiential during sleep, plausibly it is also nonexperiential during waking, perhaps merely being accompanied during wakefulness by separable experiences (e.g. visual imagery) that do not persist during sleep. So, wakeful attitudes inherit controversial status from their sleep-time forms.*

* I include emotions such as fear and hope in the category of attitudes that persist during sleep, and moods such as depression and happiness in the category of dispositions (that activate or suppress various emotions and states). So emotions and moods are controversial. Certain emotions and moods, and perhaps other states, might be *hybrids* of dispositions, attitudes and experiential “feelings”, but in that case I assume it is the “feeling” components that we need to focus on first, and not the hybrid states.

- 2e:** States that are deeply hidden from introspection, such as Freud’s repressed unconscious, “blindsight” states that enable blind people to guess correctly about visual stimuli, retinal states and other “drafts” in the early stages of vision, Heidegger’s alleged primordial ways of being in the world, and Chomsky’s alleged grammatical know-how. Someone who maintains that these are experiential can easily explain away contrary intuitions by the fact that the states are not introspectible.
- 2f:** Introspectible states that are not clearly introspected, such as the fuzzy boundaries at the edges of our visual fields, the faint pressures around our bodies a moment before we attend to them, and fleeting, subliminal perceptions—maybe they contribute to experience; maybe they don’t; maybe they (or states in any of the other categories) are vague borderline cases that are not quite experiences and not quite nonexperiences.

Fortunately, there are uncontroversial *positive* examples of conscious experiences. I think it is best to search first for principles and theories that work for these clear cases. In dealing with the unclear cases (someday), I think it best to rely on the resulting theories rather than our shaky intuitions.

I group the short remaining list of clear conscious experiences into four overlapping categories, with the proviso that these states are only clearly conscious when they are clearly introspected by Homies:

- 3a:** Perceptions (and misperceptions) caused by sense organs, such as normal tastings or seeings of environmental objects, and degraded appearances of afterimages or ringing-in-the-ears. (Mis)perceptions differ from beliefs in being tightly bound to stimuli and behavior (such as guiding visuomotor skills), and being limited in reasoning and in subject matter.
- 3b:** Bodily sensations, such as diffuse sensations of warmth or muscular fatigue, and more pointlike pains, tickles, or itches.
- 3c:** Perception-like imaginings, such as voluntary envisioning or “replaying” of one’s own actions or perceptions, and involuntary nonlucid hallucinations—but excluding dreams, due to their occurrence during sleep.
- 3d:** Elements of “streams” or “trains” of thought, such as verbal talking to oneself, or reading with the mind’s eye, and nonverbal thinking in pictures or making predictions by running through a (scale) model in one’s head. Such thoughts differ from beliefs—for example, although a single belief may persist while one is sound asleep, no single thought does.

What does consciousness require? The first sign that there may be some dependence of consciousness on meaning is that all these clearest cases of conscious experience are clearly

representations. (It is less plausible that meaning depends on consciousness, because not all clear mental representations are clearly conscious.) Perceptions and misperceptions typically indicate allegedly objective features of external objects. For example, a visual sensation might represent a certain spectral-reflectance feature or a shape feature at a certain place, or might categorize an object on the basis of many such features. Experiences of pressure, warmth, or limb position involve bodily (mis)perceptions of pressure, warmth, or limb position, while in pain experiences we (mis)represent parts of our bodies as throbbing, burning, stabbed, pounded, pinched, pulled, etc., and in each tickle or itch experience one represents parts of one's body as being rubbed or pricked with very specific intensities, directions, speeds, and contact-point sizes. Imaginings plausibly involve the same representational mechanisms involved in the later stages of perception and bodily sensation. Streams of thought seem to be constituted by imaginings of words or of speech acts, typically auditory or visual ones, as well as imaginings representing nonverbal items. It seems difficult to imagine a conscious state that represents nothing at all. And it seems difficult to vary what an experience is like without varying the experience's subject matter, or how it represents its subject matter. So it is tempting to view representational features of experience as prerequisites for conscious features of experience.

A second sign that there is some dependence of consciousness on meaning is that in all the clearest cases, conscious experiences are themselves represented by their bearers. A conscious experience not only makes its subject matter seem to exist (with certain features), but also itself seems to exist (with certain features)—seeing blurrily or clearly, hurting severely or mildly, forming images in one's head or body, etc. As Nagel emphasizes, there is not only something it is like to see red or feel pain—a feature of the seeing or the pain—but something it is like *for* the organism. Since the state itself is obviously in the creature's *possession*, “for” would be redundant unless it means “in the creature's view”, so the requirement is plausibly that there is something the state is like *as represented* by the creature. Theorists differ about whether a creature introspects the state by thinking about it, or more primitively by inwardly perceiving it, or by having the state somehow be in part about itself. Theorists also differ on whether consciousness requires ongoing introspection or mere ease of introspectibility. But in any case for a creature to have clearly conscious experiences it must be capable of mental representation.

Meaning and function

Now, what does mental representation require? The first sign that there is some dependence of meaning on teleological function is the nature of *misrepresentation*, of a misfit between what is meant and what is there. True beliefs, accurate perceptions, and fulfilled desires seem to meet some norms of *success* that false beliefs, misperceptions, and un-

fulfilled desires *fail* to meet. A belief that it is raining *ought* to go away when the rain does. These are not statistical norms (as if trillions of falsehoods were better than one), and aren't moral norms (as if commandment XI were “thou shalt not miss thy guesses”). It would be difficult to explain them as practical norms about means to one's ends, since any desire for an end is itself a success or failure in the sense to be explained. So it is tempting to try explaining the relevant norms in some fourth sense, as functions. Functions also are not statistical patterns, and aren't moral principles. And it would be difficult to explain functions as practical means to desired ends, since any desire for an end seems itself to have teleological functions in the sense to be explained.

On the other hand, some mental representations misrepresent without any failure or malfunction. Consider—and remember for later—the philosopher's Swampman, a particle-for-particle match for a Homie, suddenly and accidentally formed when lightning struck the muck. It would be a malfunction to *believe* in Swampman, since there's no such being, but it isn't a failure to have an *idea* of Swampman, or a defect to *imagine* that swamp lightning formed your physical twin. Nevertheless such representations have their own semantically-relevant teleological functions: under various circumstances ideas are supposed to help form beliefs and desires with related meanings, and under various circumstances imaginings are supposed to help test or practice the formation of beliefs and desires with related meanings. So it remains plausible that for a creature to have mental representations it must be capable of having teleological functions.

A second sign that meaning depends on functions is that both share many eerie features regarding how they enter into apparent explanations. (It's less plausible that function depends on meaning, because not all things with functions have meaning.) Since this moves us squarely into discussing functions, I describe it in the next section.

JOB ONE

To emphasize what seems eerie about teleological explanations (and meaning-explanations), I will contrast them with a pair of general but familiar explanatory relations:

- 4a: Explanation by Constitution**—For example, Angell Hall has as spatial “parts” like giant stone Legolike blocks, has as temporal “slices” various Angell-Halls-on-a-Graduation-Day, and has as “aspects,” e.g., being grey and quarantining philosophers. All these are kinds of constituents.
- 4b: Explanation by Causation**—For example, laying the Legos increased the pressure on the pillars, and blocked the upward mobility of the quarantined.

I will use the term “construction” to cover both constitution and causation. Throughout, I mean these broadly to include constituents and causes that work jointly with others, some perhaps contributing extremely little to the whole or to the effect. So “construct” stands for “help somewhat to constitute or cause”.

Now for the eerie contrasts (shared by teleological and meaning explanations):

- 5a:** Backward explanation—Barring eeriness within the constructive realm, later things can’t construct (constitute or cause) earlier things. But we routinely try to explain the existence of a belief or desire by properties of a future thing believed or desired, and the existence of an organ or tool by the future fulfillment of a function.
- 5b:** Circular explanation—Barring eeriness within the constructive realm, things can’t be constructed by things they help construct. But we routinely try to explain the existence of a belief, desire, organ, or tool by properties of a thing believed, desired, or had as a function, even while we try to explain the existence of that thing as an effect of the belief, desire, organ, or tool.
- 5c:** Absent explanation—Things can’t construct what doesn’t exist (at some time), and things can’t be constructed by what doesn’t exist (at some time). But we routinely try to explain the existence of a belief, desire, organ, or tool by alleged properties of the thing believed, desired, or had as a function, even when that thing never comes to exist.
- 5d:** Explanation at a distance—Except in the most fundamental cases involving the tiniest things and spaces, we expect there to be deeper and deeper mechanisms explaining how things construct other things. But we routinely cite evidence and principles of reasoning as explaining “why” we perceive and believe what we do,

and cite desires and intentions as explaining “why” we do what we do, without our knowing or much caring whether these lead to or fit with deeper explanations of “how”. And we routinely cite functions as explaining why objects do what they do, with little knowledge or care about whether these explanations lead to or fit with explanations of how they do what they do.

Function and history

So what does teleological function require? It is obscure how we can talk about functions in a scientifically respectable way. If one thinks of the universe as so many randomly or lawfully crashing particles, it is hard to resist the idea that the universe just is the way it is, and there are no “shoulds” or “functions” there for the scientist to describe. Nevertheless there seems to be a sharp break among scientists who act like they don’t need teleological notions, and scientists who act like they do need them. Using broad categories, that break falls between microphysicists, chemists and macrophysicists on the “don’t” side, and biologists, social scientists, and engineers on the “do” side. (We can speak of atoms or molecules or volcanoes “functioning” in various ways, but this is a pun that means little more than that they have effects. It isn’t associated with the key *teleological* talk of them as succeeding or as failing, malfunctioning or being defective.) Functions seem to enter the universe when reproduction and selection does—with living beings and their artifacts—and this is the first sign that there is some dependence of function on evolutionary design.

“Backward-looking” or “etiological” theories of function accordingly try to show how histories of reproduction and selection generate teleological functions. Very roughly, the core etiological proposal is that some entity—call it *e*—has a certain function—call it *f*—if *e* exists because it is “copied” from similar ancestors that actually did *f* and thereby increased their probabilities of reproduction in competition with other things. Etiological theories treat functions as objective, at root determined independently of the theorist’s interests or of any other mental representations, and so make functions available for a reductive explanation of mental representation. And in Ruth Millikan’s hands, most impressively, etiology is carefully construed to unify biological and nonbiological functions, handling the functions of genes, body parts, instinctive behaviors, tools and other artifacts, customs, linguistic devices, mental states, and so on.

Etiological theories dispel the eeriness of teleological explanation by recasting it as constructive explanation. It is not that some future or in-existent activity of an object explains, in a backward or absent way, the existence of an object. It is that *past* occurrences of *similar* activities explain—causally explain—the existence of the object. This introduces no circularity when the object causally explains the future fulfillment of its function. Instead of looking for gappy “why”-explanations distinct from “how”-explanations, we can look for 2nd-order how-explanations: not “how now does this mechanism work,”

but “how (in the past) did such a mechanism come to exist (or proliferate)”)? That causal question can sometimes be answered with little knowledge or care about how the mechanism works.

Since Swampman would have no ancestors, no history of selection, on the etiological theory it harbors no teleological functions. This functionlessness is no surprise. Swampman’s pulsating heartlike tissue would not be defective if it stopped pulsating, since nothing relevant to it would have set a standard for it to fail. Its lunglike tissue doesn’t inflate by (artificial or natural) design, but as a pure accident of the lightning striking the swamp. Grinding food is not a *raison-d’être* of its teeth-alikes. These structures are like interesting but functionless volcanic formations.

JOB TWO INTERRUPTS

Hearing a scary growl from the brush, Swampman zips toward the distant city lights, reaches your house, finds the door locked, then quickly enters your shed by punching in your secret combination code. Apparently Swampman hears and fears the growler, wants to protect himself, believes safety lies toward the light, and knows the shed combination. But since Swampman has no evolutionary history, on the etiological theory he has no states with teleological functions, so he has no meaningful mental states. If he has no state that malfunctions, then if there was no growl, he does not have a perception (or misperception) of a growl. If he has no state that fails if he does not hide, then he has no desire to hide. He opens your lock by the sheer accident of being your molecular duplicate, not by knowing or even guessing what the combination is. This meaninglessness is all quite a surprise, but we can start to understand it. Just as there can be things that are *similar* to English sentences but that *aren’t* really meaningful sentences (e.g., gibberish, or shapes and sounds formed by the wind, or ink merely spilled on a page—mere meaningless sentence-alikes), so there can be things similar to thoughts but that aren’t really meaningful *thoughts* (e.g., perhaps data and programs in a laptop computer, or shapes and sounds and electrical discharge merely leaking in a soul or brain or mind—mere meaningless thought-alikes).

If it turned out we are *all* Swampfolk rather than evolved beings, there would be no thoughts at all, only thought-alikes. A strange possibility, but one we can begin to get comfortable with, using the analogy of meaningless sentence-alikes. It would not surprise us to discover this; it would merely surprise-alike us to discover-alike this. Of course no one would bother even trying to talk or think if nothing means anything, but only because no one would bother trying anything (versus bother-alike-ing try-alike-ing). The meaningless talk-alikes and thought-alikes would just continue to happen.

Now if consciousness in turn depends on meaning, consciousness also depends on a history of reproduction and selection. Swampman would have no conscious experiences;

there would be nothing any of his states is like for him. This nonconsciousness is a huge surprise. Meaningless sentence-alikes look or sound intrinsically like sentences with functions; all that’s missing is the meaning. So it is tempting to treat Swampman’s meaningless thought-alikes as sharing Nagel’s “subjective character” or Levine’s “qualitative character” with conscious thoughts; all that’s missing is the nonintrinsic meaning about the external world. But without meaning and function there is also no *internal* world “for” a “subject”. No perceiving eyes, and no introspecting mind’s eye. We could describe some of Swampman’s states as experience-alikes, but since there would be nothing it is like for him to be in these states, they would be no more similar to conscious experiences than our own nonconscious states are. And to the extent that certain moral rules stem from what we should or should not do to those who feel pain, since there is nothing it is like for Swampman to feel pains, these rules would not apply to our treatment of him. Apparently it’s not who your parents are, it’s whether you have parents.

When we try to get our heads around the possibility that we are Swampfolk, it seems even more mysterious how our states could be wholly nonconscious than it is how our states could be wholly meaningless. Our continued assurance that we have *meaningful* states, in the face of the possibility of being Swampfolks, might be based on a subtle working assumption—we might as well act as if we have beliefs, since if we do not, at least we are not mistaken. Or it might be based on more elaborate reasoning, such as our considerable evidence that we are in fact evolved creatures. But our assurance that we have *conscious* states seems more directly supported than that. It is tempting to say we know we are conscious just because we are conscious. This knowledge seems independent of the environment outside us because the conscious experiences seem independent of the environment outside us. Our pains, and our resulting moral status, seem to be constituted only by how our mind-brains are here and now. Or perhaps they are partly constituted by a little bit of the environment—aspects of our bodies, or of the past few seconds of stimuli and behavior. But—slap to the head!—how could whether *this* hurts depend constitutively on distant facts about my evolutionary history?

JOB ONE CONTINUES

To secure functions for Swampman, and sometimes for other motivations, philosophers have tried three chief alternatives to the etiological theory. These are attempts to understand functions without dependence on evolutionary histories of reproduction and selection.

Function without history

First, John Bigelow and Robert Pargetter argue that functions stem from “forward-looking” survival-enhancing *dispositions*, rather than “backward-looking” survival-enhancing *prior activities*:

The etiological theory describes a character [= feature] *now* as serving a function, when it *did* confer propensities that improved the chances of survival. We suggest that it is appropriate, in such a case, to say that the character *has been serving that function all along*. Even before it had contributed ... to survival, it had conferred a survival enhancing propensity on the creature. And to confer such a propensity, we suggest, is what constitutes a function. Something has a (biological) function just when it confers a survival-enhancing propensity on a creature that possesses it.

On this propensity theory Swampman's structures, states, and processes have functions *from the first moment* if they are disposed to increase Swampman's chances of survival.

Second, Robert Cummins dispenses with the teleological thesis that functions explain existence or survival, and substitutes the idea that functions stem from contributions relatively simple things make to the relatively complex capacities of containing systems:

x functions as a ϕ in *s* (or: the *function* of *x* in *s* is to ϕ) ... just in case *s*'s capacity to ψ [is appropriately and adequately accounted for] by, in part, ... the capacity of *x* to ϕ in *s*.

An account of capacities "becomes less and less appropriate, and talk of functions makes less and less sense" as "the relative complexity of the organization of component parts/processes that is attributed to the system ... becomes less and less significant". On this organizational theory, from the first moment, Swampman's complex capacities (to run, to open combination locks, etc.) can be accounted for by much simpler contributions of many of Swampman's parts, so these accounts describe the functions of these parts in Swampman's overall organization.

Third, John Searle reverses the dependence relations described in Job Two, maintaining that functions depend on conscious meaning. He writes that:

functions are never intrinsic to the physics of any phenomenon but are assigned from the outside by conscious observers and users... Thus given that we already accept that for organisms there is a value in survival and reproduction, and that for a species there is a value in continued existence, we can *discover* that the function of the heart is to pump blood If we thought the most important value in the world was to glorify God by making thumping noises, then the function of the heart would be to make a thumping noise

On this attributional theory, from the first moment, Swampman harbors whatever functions our desires require him (or his parts) to achieve the goals someone sets. Our existence is not required—Swampman's own desires, or those of a by-

standing deity, could provide the requirements. Moreover, Searle thinks Swampman could have desires independently of functional attributions, because meaning and consciousness do not depend on functions.

Each of these three alternatives has some merit alongside that of etiology, and perhaps the dominant tendency is to a pluralism that accepts versions of multiple theories as separately sufficient for functions. Perhaps "function" is ambiguous, and each theory is correct about a distinct concept of function. Perhaps different theories are best restricted to different sorts of function-bearers (say, etiological or propensity theories for biological organs, and organizational or attributional theories for artifacts). Lopping together an etiological theory with an independent nonetiological theory would enable Swampman to have functions (and meaningful representations, and consciousness), but doing so too quickly would be cheating ourselves. It would give us no account of why we treat these different kinds of functions alike. It would give us no guidance about what other sources of functions there may be—if there are these four kinds of functions, why not also functions as activities we *dislike*, functions as propensities whose shortest representation in German *rhymes* with the shortest English representation of contributions to containing capacities, etc.? Pluralism without unity is for quitters.

Function and construction

I would now like to show how an account of functions can generate improved versions of the main alternatives to the etiological account. Then I will use this account to derive the etiological theory, unifying them all in the process. What I think functions have in common is their role in teleological explanation—the apparently eerie, apparently nonconstructive, backward/circular/absent/distant explanation described at the beginning of Job One.

Suppose *e* is an entity (object, event, fact, property) with function *f*. The teleologist asks: why does *e* exist (at all, or with certain features)? The teleologist answers: because *e* does *f*. The "does *f*" is clearly constructive—meaning "helps constitute or cause *f*". But since things malfunction, and teleology allows for absent explanation, "does *f*" has to be construed softly, perhaps as "possibly or conditionally or with increased probability helps construct *f*". Since that's a mouthful, I'll risk misunderstanding and rely on the phrase "helps construct" to convey the softness. (Compare: we have no ready understanding of "I built the bridge, but in the end it didn't get built" but we can easily understand "I helped build the bridge, but in the end it didn't get built".) So the teleologist's explanation is that *e* exists because *e* helps construct *f*.

My first suggestion is that this "because" also stands for constructive explanation, rather than for an eerie *sui generis* explanation. The teleologist cites a fact involving *e* (a possibility, or conditional fact, or probability) as constructing *e* (perhaps together with other causes or constituents of *e*). So this fact involving *e* would have to exist, and have powers of

well as his heart already has that function. But there is no useful sense in which my heart is defective whether it pumps blood or not, and no useful sense in which the thumping is *its own* function. By restricting the role of beliefs and values to those that help construct an object—the *designer's* values and beliefs—this modification of Searle's theory enforces reasonable limitations on whose attributions matter.

Second Searle seems to think that valuing f makes f a function of anything that is a means to f , even if the valuer never intended or thought of the means. He says that even if no one ever heard of hearts, a desire for survival makes a heart have the function of pumping blood because hearts contribute to survival by pumping blood. Now braided hair also contributes to survival under various circumstances, such as when some nearby bad guys happen to be out to kill anyone with unbraided hair. But even if a person's survival is valued by the very person who constructs her hair braids (for show), this does not give the hair braids a function of thwarting the bad guys. By restricting the function-endowing role to the specific *means-end attitudes* of the designer or maintainer, the modified attribution theory gets this right.

Third, not even designers and maintainers with relevant means-end thoughts may go hog-wild in establishing functions. Even if I design and construct a tool, say a small fork suitable for extracting pomegranate seeds, I cannot endow it with just any old function, such as establishing world peace, and thereby render it defective. Even if I sincerely believe that it would help construct world peace, and make it for that reason, if this belief is not caused by a (funky) *fact* that it would help construct world peace, my attributions and values generate no matching function.

The Three Ways of Constitution

The third through fifth ways for a funky fact involving an entity to construct that entity exploit a sense in which whole entities *trivially* inherit constructive relations from their constituents. If a part of Angell Hall helps cast a shadow to the west, then Angell Hall helps cast the shadow. If a part of Angell Hall helps constitute an entrance to Mason Hall, Angell Hall helps constitute the entrance. (We have to be careful not to imagine that every part of Angell Hall is active in casting the shadow, or that every part of Angell Hall is within the entrance, but still, in a sense, and perhaps by courtesy, Angell Hall helps cast the shadow and helps constitute the entrance. I will omit these qualifiers for ease.) The importance of this inheritance is that it is trivial, that it is without further necessary conditions. If we treat e as a whole composed of constituents, and inheriting constructive powers from these constituents, we can understand a funky fact *{if e were to exist, e would help construct f }* as reducing to facts about what constituents of e do, perhaps independently of e 's existence.

The idea works as follows. Let c be a constituent of e . Then if c helps construct f , trivially e helps construct f . Now instead suppose e does not exist (yet), but c (already) does, and helps construct f . Then the following two conditions can easily hold prior to e 's existence:

- If e were to exist, c would be a constituent of e .
- If e were to exist, c would help construct f .

If both conditions hold, then trivially the funky fact holds:

{if e were to exist, e would help construct f }.

Since the funky fact is nothing more than the conjunction of the two conditions, for the funky fact to construct e all we need is for the two conditions to construct e . This occurs when c 's activity (f) helps construct e . Then we have e existing because *{if e exists, e helps construct f }*, which satisfies the theory of functions.

Well, it does so with one further complication. As soon as e comes to exist through constituent c 's activity f , e trivially inherits c 's activity, so it may be in a sense that e automatically constructs the f that helps constructs it. If f is a function of e , then in that sense e automatically fulfills its function. To allow for teleological malfunction, e 's function must be a *further* performance of f , beyond that which constructs e .

There are three resulting Ways to satisfy the general theory of functions, because there are three kinds of constituents: spatial parts (the Lego blocks helping to make up Angell Hall), temporal slices (the Angell-Halls-on-a-Graduation-Day helping to make up Angell Hall), and aspects (the greyness helping to make up Angell Hall).

The Way of Spatial Parts (Containing Systems)

Let p be a spatial part of e , and substitute it in the reasoning about constituent c above. Here e is something larger than p , something that contains p as well as other spatial parts. For the existence of *{if e were to exist, e would help construct f }* we need these two conditions to hold prior to e 's existence:

- If e were to exist, p would be a part of e .
- If e were to exist, p would help construct f .

The funky fact constructs e when these two conditions construct e . This happens when e 's organization (out of various smaller spatial parts) is created or sustained by the activity (f) of part p , when what p does helps bind e together. In this case, e has (further) performance of f as a function.

This captures what is plausible, for the generation of functions, about Cummins's emphasis on the organization of containing systems. First, Cummins' is rightly concerned about the following trivialization of his theory:

No matter which effects of something you happen to name, there will be some activity of the containing system to which just those effects contribute, or some condition of the containing system which is maintained with the help of just those effects. Heart activity, for example, keeps the circulatory system from being entirely quiet, and the appendix keeps people vulnerable to appendicitis.

To exclude these nonfunctions, he tries restricting functions to relatively complex systems organized out of relatively simple parts. But this does not do the trick. By his standards a heart's pumping blood has to count as a simple part of the whole relatively complex circulatory system. But then a heart's noisily pumping blood must count as an equally simple part of the whole relatively complex noisy-circulatory system. Furthermore, even simple systems can succeed or fail, in as full-blooded a sense as complex ones can. On the modified organizational view here, what excludes the heart noise is that the noise doesn't help to organize the circulatory system, the noise does not help bind the spatial parts together.

Second, under the stated conditions the organization of a system does not necessarily endow the *parts* of the system with functions, but it does necessarily endow the *whole* with functions. If *e*'s part *p* ceases to perform *f*, something is wrong teleologically with *e*. It is not necessarily the case that *p* malfunctions, since the problem may lie elsewhere in *e*. But *e* as a whole malfunctions. If a heart doesn't pump blood, this may be because all the blood has drained out through a hole in the foot. That's not a defective heart, it's a defective foot—a defective containing system. Hearts can get their own functions by themselves having parts that organize into hearts, or in any of the other ways described above and below.

The Way of Temporal Slices (Self-driven Survival)

Let *s* be a temporal slice of *e*, *e* is a temporally extended "worm". For *e* (the whole worm) to exist is for *e* to *survive* (or *persist*) from one time to another. For the existence of the funky fact *{if e were to exist, e would help construct f}* we need these two conditions to hold prior to *e*'s survival:

- If *e* were to survive, *s* would be a slice of *e*.
- If *e* were to survive, *s* would help construct *f*.

The funky fact constructs *e* when these conditions hold, i.e., when *e*'s survival is caused by its past activity (*s*'s doing *f*).

This captures what is plausible in Bigelow and Pargetter's propensity theory. As in their theory, there is no need for the activity of *e*'s ancestors. Being a time slice, *s* is capable of causing *f* and thereby causing *e* to survive. You can think of later time slices as being reproduced from ancestral time slices, in which case the later slices have *f* as their etiological functions, or you can think of them all as being part of the worm, so that the worm itself has nonetiological functions.

The worm as a whole needn't have ancestors: it can develop functions by contributing to its own survival.

But there should still be a need for *actual* survival activity in the immediate, recent, or distant history of the creature. Otherwise there is no way to apply their notion of a propensity. As Bigelow and Pargetter acknowledge, propensities are relative to particular conditions:

A character [= feature] may confer propensities which are survival enhancing in the creature's usual habitat, but which would be lethal elsewhere. When we speak of the function of a character, therefore, we mean that the character generates propensities that are survival-enhancing in the creature's natural habitat.

For a creature without any history (Swampman at the first moment) there is no such thing as its "usual" habitat. Even for a creature with a history, we can't count "usualness" merely by time spent. Suppose that unbeknownst to us, after each five minute period we spend in this dog-eat-dog world, we are whisked away to a protected environment for an hour to "recharge" in suspended animation, and then rereleased into the wild for the next five minutes. Statistically our usual habitat is the recharging station. But our function-relevant habitat is our statistically unusual world where we (even if not our ancestors) perform actual survival-enhancing activities, as reflected in the modified propensity theory.

Given a (possibly very brief) history of survival-enhancing activity in an environment, propensities in that environment drop out as unnecessary. If a creature survives by its own activity in an environment, but more by *fortunate* activity than by the exercise of a reliable propensity, this still establishes a norm for similar activity to live up to. Full-blooded teleological explanation allows not only for entities that happen not to fulfill their functions, but for entities that *cannot* (reliably, without luck) fulfill their function in their natural habitat—entities without a propensity to fulfill their function. A failing heart does not stop failing at the moment it loses all propensity to pump blood. At that moment it fails worst.

The Way of Aspects (Reproduction and Selection)

Finally, let *a* be one of the aspects of *e*. For the existence of the funky fact *{if e were to exist, e would help construct f}* we need these two conditions to hold prior to *e*'s existence:

- If *e* were to exist, *a* would be an aspect of *e*.
- If *e* were to exist, *a* would help construct *f*.

The funky fact constructs *e* when these two conditions construct *e*. Assuming aspects are abstract objects (e.g., properties), and barring direct causation by abstract objects, for an aspect of *e* to cause *e*, it must be instantiated in something prior to *e*. Suppose that *a* is so instantiated, and thereby its activity (*f*) constructs *e*. The prior thing is similar to *e* (in sharing aspect *a*), and its similarity is relevant to causing *e*

(via f). This prior thing is therefore an “ancestor” of e in Millikan’s sense, one that “reproduced” to form the similar “copy” e . Now, since the ancestor did f in virtue of having property a , we can say that a helped construct f . Unless e is very different from the ancestor, then, if e had existed, it would have helped construct f . So again we have the preexisting funky fact $\{if\ e\ exists,\ e\ helps\ construct\ f\}$, and we satisfy the general theory of functions.

I think that tracing out this line of thought in more detail would lead to an improved formulation of the etiological theory of functions, better able to handle counterexamples and complaints about it as a stipulative change of subject. But for now suffice it to say that there seems to be a way to justify versions of all the leading theories of functions, under the unified “ e exists because e would construct f ” rubric.

JOB ONE IS DONE; JOB TWO IS DUE

While a history of reproduction and selection stands as one way to have functions, it is not the only way. Things suddenly created by the Form of the Good can have functions via their classical final causes. Things suddenly created by intelligent design can have functions by the means-end reasoning of their designers. Things suddenly created by lightning in the swamp can acquire functions by their own survival activity and the activity of their parts in maintaining their organization. Under the right circumstances Swampman can have conscious mental representations from moment two, even if not from moment one. Our assurance that we are conscious, in the face of the possibility that we are Swampfolk, need not rely on our theories of evolution by natural selection of distant ancestors. Though not quite immediate and certain, it is supported by our knowledge of our own continual activities to stay alive and in one piece.

Eric Lormand is an Associate Professor of Philosophy. Eric came to Michigan in 1991, just after completing a Ph.D. at MIT under the supervision of Ned Block. Much of his research has concerned those aspects of mental phenomena that have inspired challenges to cognitive science: especially, the nature and status of conscious experience, mental representation, self-knowledge, emotions, skills and rationality.

He is currently pursuing a major project in epistemology that concerns the justification of logical reasoning and inference to the best explanation. He is also interested in issues related to phenomenology and metaphysics.

References and Suggestions for Further Reading

- Aladdin’s lamp is rubbed in Huxley’s *Lessons in Experimental Physiology*, p. 210. The stage-setting quotes about conscious experience are from Nagel’s ‘What is it like to be a bat?’, reprinted in his *Mortal Questions*, and Levine’s ‘On leaving out what it’s like’, reprinted in Davies and Humphreys’ *Consciousness*.
- For panpsychism, see section 8.4 of *The Conscious Mind* by David Chalmers, the most dogged Doubting Thomas. Daniel Dennett is the best source for keeping contentious cases of consciousness contentious—see especially ‘Why we can’t make a computer that feels pain’ and ‘Are dreams experiences?’ in *Brainstorms*, and his reliance on language and culture in *Consciousness Explained*.
- Over the course of several exchanges, Ned Block proves to be the most dogged critic of the idea that consciousness requires meaning, and Michael Tye proves to be the most dogged defender of the idea. See William Lycan’s “Representational theories of consciousness” in the online *Stanford Encyclopedia of Philosophy*, <http://plato.stanford.edu/entries/consciousness-representational/>.
- Ruth Millikan’s *Language, Thought, and Other Biological Categories* best develops the case that meaning depends on function, and best develops the etiological theory of functions. But “Biosemantics”, reprinted in her *White Queen Psychology*, is the easiest introduction.
- The most challenging counterexamples to etiological theories of functions are found in Christopher Boorse’s “Wright on Functions” (*Philosophical Review*, 1976).
- For nonetiological theories, see Bigelow and Pargetter’s “Functions” (*Journal of Philosophy*, 1987), Cummins’ “Functional Analysis” (*J. Phil.*, 1975), and the first chapter of Searle’s *The Construction of Social Reality*.
- For classical teleology and abstract causation, see Plato’s *Republic*, Book VI, 509b, and A. Falcon’s “Aristotle on Causality” in the *Stanford Encyclopedia of Philosophy*, <http://plato.stanford.edu/entries/aristotle-causality/>.
- Leslie’s *Infinite Minds* is an impressive defense of an abstract teleological explanation of concrete reality.
- Swampman first appeared in Donald Davidson’s “Knowing one’s own mind”, reprinted in his *Subjective, Intersubjective, Objective*.

SPOTLIGHT ON RECENT GRADUATES

Erica Lucast Stonestreet defended her dissertation — *Self-Creating Reasons: The Normative Implications of Identity* — in May under the supervision of Steve Darwall (chair), Liz Anderson, Sarah Buss and Scott Shapiro. The work is a study of self-creating reasons that create and reconstitute the self. In addition, her essay “Informed Consent and the Misattributed Paternity Problem in Genetic Counseling” appeared in the prestigious journal *Bioethics*. Erica was the first recipient of the *Marshall M. Weinberg Summer Dissertation Fellowship*, awarded Summer 2008. She also received the 2007/08 *Susan Lipschutz Award for Women Graduate Students*. Erica began teaching at the College of St. Benedict/St. John’s University in Collegeville, MN this fall.

Joshua Brown defended his dissertation — *The Crooked Path from Language to Metaphysics* — with Anthony Gillies and Peter Ludlow as committee chairs, and Peter Railton and Andy Egan as members. The dissertation is a critical examination of the ways in which philosophers use semantic theories in drawing conclusions about the world. Josh proposes an interpretation of such theories on which they have few, if any, interesting metaphysical consequences. Also Josh’s paper “Spatial Infinity and the Intuition of Space” won the 2006 *Markus Herz Prize* awarded by the North American Kant Society. Josh began a tenure-track position as an Assistant Professor at the University of Houston in the fall of 2008.

Gabriel Zamosc-Regueros completed his dissertation — *An Interpretation of the Ideals of Sovereignty, Wholeness, and Becoming What One Is in Nietzsche’s Practical Philosophy* — under Steve Darwall’s supervision. Committee members included Jamie Tappenden and Michelle Kosch. Gabriel’s thesis explores Nietzsche’s moral psychology. Among other interesting and illuminating claims, he defends the controversial thesis that, for Nietzsche, having a sovereign conscience means seeing oneself as a morally responsible agent. This comes at the cost of being subject to blame and guilt. Gabriel begin his academic career this fall as Assistant Professor at University of Colorado, Denver.

Jim Staihar, a Harvard J.D. who also specializes in the philosophy of law, completed a dissertation — *A Restorative Signaling Theory of Punitive Desert* — under the guidance of Liz Anderson (chair), Steve Darwall and Allan Gibbard. The work offers a novel theory of punitive desert that seeks to explain the degree to which criminals deserve punishment. According to Jim, when someone commits a crime without an exculpatory defense, she undermines conditions of trust, and thus deserves to be punished no more severely than the burdens she is obligated to undertake to restore the conditions of trust. Jim began a postdoctoral fellowship at the University of Chicago in Law and Philosophy in the fall of 2008.

In Memory
Arthur Walter Burks
1915 – 2008

Arthur Burks, professor of philosophy and computer science, died on May 14, 2008 at the age of 92. Art, a member of Michigan's faculty from 1946 to 1986, is best known for his work on the logic of computer programming in the late 1940's, which helped launch the digital age. He also did pioneering work in the logic of causality and probability, the foundations of semiotics, and the history of computing. Art was also one of the world's leading scholars of the American pragmatist Charles Sanders Peirce.

Born Oct. 13, 1915, in Duluth, Minnesota, Art received a B.S. in mathematics from DePauw University in 1936, and then earned a Ph.D. in philosophy from the University of Michigan in 1941, with a dissertation entitled *The Logical Foundations of the Philosophy of Charles Sanders Peirce*. During World War II, Art served as a principal architect for the first programmable electronic digital computer, the ENIAC. During this period he worked closely with the great mathematician John von Neumann and the computer scientist Herman Goldstine. Their jointly-authored 1946 paper "Preliminary Discussion of the Logical Design of an Electronic Computing Instrument," ranks among the most famous in the history of computer science. It described the design for the programmable computer, and is credited with containing the first discussion of modern computer programming. In further collaboration with von Neumann, Burks completed and edited an essay, "Theory of Self-Reproducing Automata," which contains the first descriptions of processes by which non-living things might reproduce themselves.

Art joined the Philosophy Department in 1946, and in 1949 founded the *Logic of Computers Group*, the first organization on campus dedicated to the study of computing. He helped start the graduate program in communication sciences in 1957 and the Department of Computer and Communication Sciences (CCS) in 1967. He served as its first chairperson in 1967-68. The CCS program blended computing, the study of language, machine learning, and complex systems. In 1984 he joined the Department of Electrical Engineering and Computer Science.

Though he was perhaps best known for his contributions to the development of the theory of computing, Art also made wide-ranging contributions to philosophy. He did ground-breaking work in the philosophy of science, making significant additions to our understanding of causality, the character of laws of nature, inductive logic and of the role of probability in rational decision making. His *Chance, Cause and Reason* (Chicago, 1977) remains influential some thirty years after its publication. He served as *President of the American Philosophical Association*, Western Division, for 1972-73, and as president of the *Philosophy of Science Association*, for 1975-76. Art also edited two volumes of the *Collected Works of Charles Sanders Peirce*, and served as president of the *Charles S. Peirce Society* in 1954-1955.

He was the recipient of many awards and honors including the Henry Russell Lectureship in 1978 – one of the highest honors the University of Michigan confers on a senior faculty member. Art retired from active faculty status in 1986. After retiring, he co-authored many articles with his wife, Alice R. Burks, on the history of the computer. Their book *The First Electronic Computer: the Atanasoff Story* (Michigan, 1989) is a landmark in the history of computing.

We mourn the loss of our colleague, a kind and generous man, and extend condolences to his wife of 65 years, Alice W. Burks, and to his three children, Nancy, Edward and Douglas.

— Jim Joyce, Chair Department of Philosophy

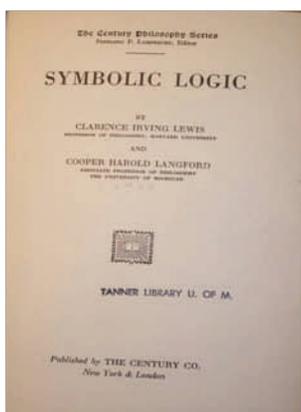

Alumni News

Over the years we have asked you to update your contact information and share any news or updates with the department. We would now like to share these updates with your fellow alumni.

2004

Anthony Nguyen, B.A.

Hello, I would like to receive Michigan Philosophy News every year. I enjoy hearing about the faculty's happenings & new lecturers coming to UM.

As far as my happenings, I will be attending Chicago-Kent College of Law & I will be focusing on Intellectual Property as well as legal jurisprudence. Eventually, though, I would like to find myself in graduate school (hopefully in AA) seeking my doctorate in Philosophy.

I owe much thanks to Velleman & Kamtekar for their engaging lectures, as well as the rest of the faculty and GSI's.

Thank you for a life-changing experience I will never forget.

Sincerely,

Anthony Nguyen '04

Department Faculty 2008-2009
