Energy justice is one of the central global issues of our time, with profound implications for health and welfare; freedom and security; equity and due process; and technology development and implementation. Thus, an energy-just world is one that equitably shares both the benefits and burdens involved in the production and consumption of energy services, as well as one that is fair in how it treats people and communities in energy decision making. This course explores the intersection of energy and equity issues related to a variety of domestic energy dynamics to include ways for rectifying persistent unequal distributions of energy resources to ensure the right of all to access reliable, clean, and affordable modern energy services. This course seeks to merge academic learning and empower social responsibility in the context of energy related injustices. Community based learning values information beyond the academic setting.
